

Building instructions

I offer everyone the instructions for building for the energy cone and hearts as we are already with so many people who manufacture and distribute the cone. Only together we can achieve a lot. Every thought it would be our goal to profit is not conducive to the cause.

The development has indeed taken a few years time, the production itself is all the more easier because everything is pure nature. If you want you can even produce energy Orgon cones and heart according to these instructions, it is really easy to produce something and then you can distribute the cone and hearts in your region and also give away as gifts to others.

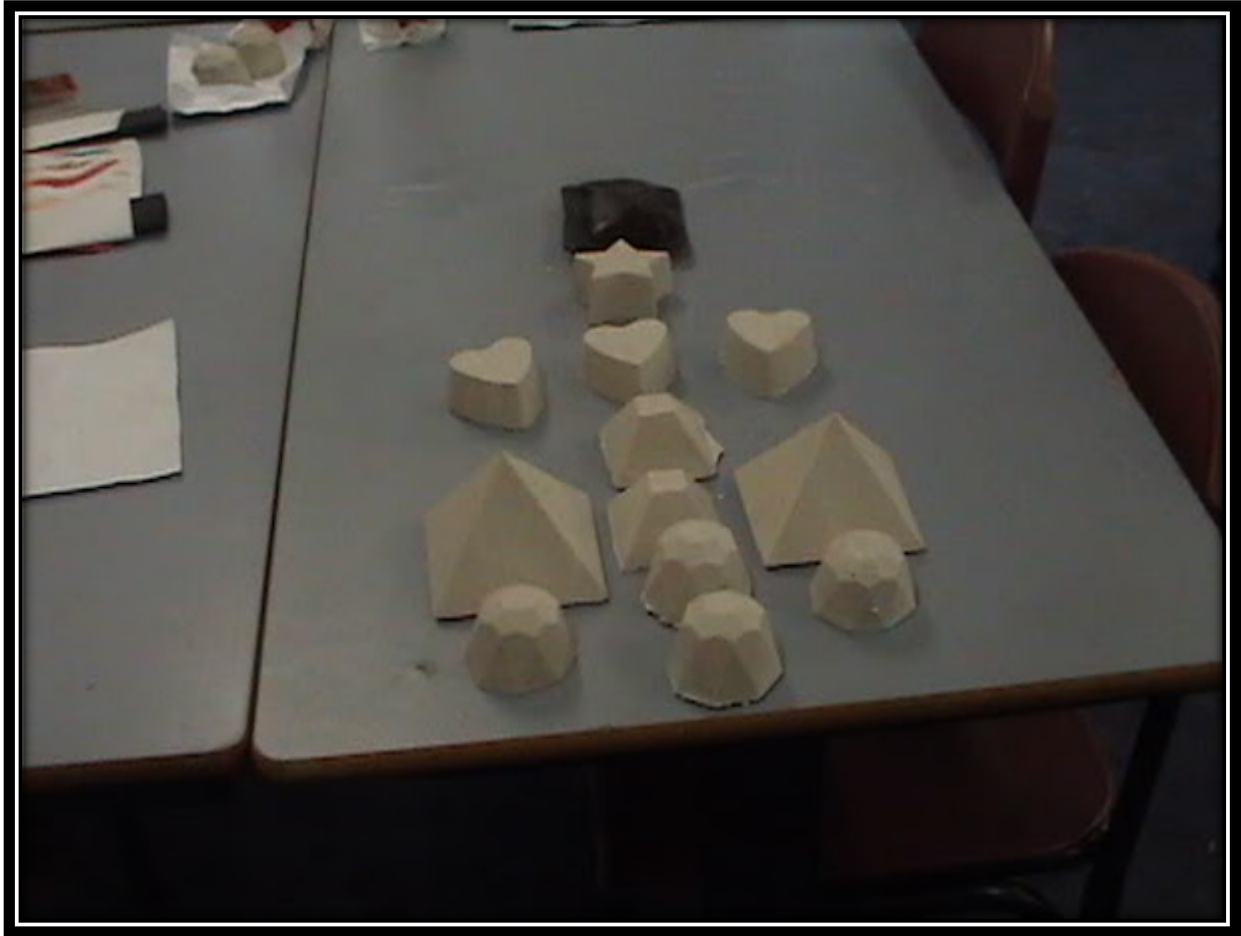

We even have some schools in Australia and Sweden, where in the classroom after my instructions these things are prepared. Students can easily take them home . What improves the health situation of the whole family and enhance academic performance of the students since they go with more fun, joy and energy in learning.

It would be very glad if also teachers from Germany and other countries would find, so as to refer also to other schools in their teaching.

These are shapes used in a class, who build after my guidelines.

I love to imagine the building instructions with tips for casting are available, the building guidelines are available for everyone, because only together we can achieve a lot.

It makes me very happy if you want to build something yourself, even more so when you go the natural route, using natural materials. Children have real joy at building it themselves and to later enjoy the benefits too. Here is a guide for you. You should use gypsum as pure as possible look at the DIY store for a hobby plaster for casting, if no additives are listed on the package, it is pure gypsum. The cheaper of the plaster, the purer it is usually because additives cost money.

Take many different gems / minerals (about 100 small stones) as you can get, the more diverse all the better.

Silica (quartz) sand from the beach is still the cheaper option, as there are also many small crystals and minerals essentially (and some sea salt). I always take a lot of different gems. But those gems can also be slightly larger.

You can use a form, best to use plastic/silicone, apply a tiny amount of olive oil into the form there pour the plaster-water mixture pure, like it says on the box of plaster, each plaster reacts as something different. Mix with the sand/gems and a spoon of natural salt. It is best for the stones to be well distributed (randomly as in nature), as that is the best way to replicate the neutralizing and harmonizing energies of nature replicate. And if you're want to give a part of the energy certain direction, you can use a natural grown rock crystal

After 30 to 60 minutes you can turn the forms and easily get the slide out. This must then dry for some days to be completely dry, at room temperature this will take about 3 to 4 days. That's the best way.

Everything should remain as natural as possible, thereby creating only one neutralizing and harmonizing energies to form in nature. Which can then be used quite universally, as varied as nature itself.

The size is not as important, but more so the distribution and reaching of many people. The cone appears small only on the visible level it is on the energetic level huge. On the energy level, for example, the cone the size of a skyscraper which corresponds, to put it symbolically. Therefore the apparent size is not so important.

The cone and hearts only consist of natural ingredients, which is why no metals werden. Poured metals

obstruct the natural flow of energy and weaken the effect. Therefore please do not pour metals into the plasterite.

The heart and the cones are also often nibbled at by deer, horses, dogs and cats and sometimes completely eaten. Animals do this to replenish their mineral balance. Do not be surprised when it comes to animals like to eat the plasterite.

This calls for some responsibility from us, which is why I don't pour metal shavings. As mentioned above already, the metal shavings would also obstruct the natural flow of energy, as there are usually alloys of metals that do not occur in nature. Gems can contain natural ores ranging as metals this is perfect as they are purely natural.

Then I wish you a lot of fun and success if you like to create something.

As already mentioned above, also for children it makes this much fun working with the plaster.

If the cone or the heart are there, just you have to protect against rain.

If you want to place the cone outdoors, for example in a garden which is further away from the house, then you can take one of the following tips to make Weatherproof around the cone.

One can make the cone and the hearts weatherproof with 2 or 3 layers of environmentally friendly clearcoat paint. It would also be sufficient and easy to protect against rain by using a glass or plastic cover for the cone and the heart or simply put it under a roof. It is fun to paint and then apply a final clear coat on it.

Even painted the cone and the hearts work 100%. Paint that is suitable for children's toys, is best to be used. We have with us also cones are permanently unpainted outdoor, one can see the traces of the cones, but they work even after years of 100%. And also survive the winter.

You can also bury the cone and hearts into the ground. On the surface of the cone and hearts even crystals begin to grow. Here are some pictures of cones and hearts that have been painted.

Once the variant with clear lacquer paint

And a more colorful variant.
